

Specification Sheet

UPVC Walling System

Specifications

Spaciotempo's walling system consists of interlocking UPVC panels with unventilated air sections, and steel reinforcements. Unless otherwise specified walling colour is a standard light grey RAL 7035.

Although this standard system with unventilated air sections does assist climate control, a far superior level of insulation can be achieved by using expanded polystyrene infill within the air sections (tests by the Building Research Establishment in November 2005 recorded a U value of 1.19 W/m²K).

Steel reinforcement sections can also be included with either system. Choosing polystyrene infill walling, together with our Insulated Roofing system, will help create a dependable, efficient and attractive environment for cold or chilled storage as well as public facilities such as sports halls, showrooms, supermarkets, dining and bar facilities.

The UPVC walling itself is also made from recycled plastic bags, making them a re-usable but environmentally friendly alternative to other walling solutions on the market.
